## RE: AI DEVELOPER — AI CENTRE OF EXCELLENCE, MELBOURNE CBD

6 November 2026

Hiring Team, ISS Facility Services Australia and New Zealand

Dear Hiring Team,

I am applying for the AI Developer role in your AI Centre of Excellence, based in your Melbourne CBD office. The ad describes taking AI opportunities from concept to pilot, deployment and scale, on solutions that are practical, reliable, secure and worth what they cost. That is the kind of AI work I have been doing.

**Generative AI and agents.** I built an MCP server that lets Claude Code or Cursor hand lightweight tasks to a locally hosted Gemma model instead of spending frontier-model tokens. It falls back to the frontier model whenever the local one is unavailable, so the user is never blocked. User accept/reject feedback curates a dataset that a QLoRA notebook fine-tunes on. I also built a retrieval-grounded (RAG) chatbot with anti-hallucination constraints, deployed on Vercel. In my AI/ML internship at Prodegee, I built a Claude API router that classifies each task with a cheap model call and sends it to the cheapest model that can handle it.

**Evaluating what was built.** At Prodegee I built an IoU evaluation harness that traced three failing generators to a problem one stage upstream. A sensitivity harness found the parameter behind a 90% under-count, and fixing it lifted the result from 0.069 to 0.415. I co-built a satellite-verified ground-truth set that corrected a published baseline from 6–13% to 37%.

**Business requirements to production.** At Vayaa, where I am a full-stack developer intern, I turn each plain-language request into numbered requirements and keep a decision log of choices, alternatives and cost. I ported the enquiry API from Rust to Python (FastAPI) and gated the switch-over on 50 parity tests. I took it live on AWS with CloudFormation, which meant working through account limits and enforcing verified TLS to the PostgreSQL database.

To be direct about the gap: I have not yet built on Copilot Studio, Power Platform or Azure AI Foundry. My cloud and LLM work so far is on AWS and the Anthropic API. The underlying patterns are the same ones your stack uses: prompts, retrieval, orchestration, API integration, evaluation and cost control.

I hold full Australian working rights (Temporary Graduate visa, subclass 485, no sponsorship required), live in Melbourne and am available immediately. I would welcome the chance to discuss how I can help the AI Centre of Excellence move ideas into deployed solutions.

Yours sincerely,

Faraaz Mohammed
